

What is a Website?

A website is a collection of interconnected web pages stored on a server and accessed through the internet using a web browser.

What is HTML?

HTML stands for HyperText Markup Language.

HyperText: Means documents can be connected using links.

This creates the World Wide Web where pages reference each other.

Markup: Content is surrounded by special symbols called tags that describe its meaning.

Example: heading, paragraph, image, navigation etc.

Language: HTML follows a standardized syntax so every browser understands it the same way.

What is a tag?

Any word written inside angle brackets < > is called an **HTML tag**.

Tags describe what content represents (heading, paragraph, image etc.).

Most tags have opening and closing parts. Some tags act as containers, while others act as standalone instructions.

Example:

```
<p>This is a paragraph</p>
```

Self closing tags example:

```
<br> break
```

```
<hr> horizontal line
```

```
<img> to add image
```

Structure of an HTML Document

Every webpage must follow a fixed skeleton so the browser understands how to read the file correctly.

Parts of the Structure

DOCTYPE Declares the HTML version (HTML5).

It tells the browser to use modern display rules instead of old compatibility mode.

html The root element. Everything written in the webpage must be inside this element.

head Contains information ABOUT the page, not visible content. Examples:

- page title
- linking CSS
- meta information

title The name shown on the browser tab. Example: "My Portfolio"

body Contains all visible content — text, headings, images, links, tables and forms.

Complete Basic Example

```
<!DOCTYPE html>
<html>
<head>
  <title>My First Page</title>
</head>
<body>
  Hello World
</body>
</html>
```

Headings

Headings organize content hierarchy similar to book chapters.

Example:

```
<h1>Main Title</h1>
<h2>Section</h2>
<h3>Subsection</h3>
```

Paragraphs & Text Meaning

Paragraph represents a block of idea.

Example:

```
<p>This is a paragraph explaining HTML.</p>
```

Line Break & Separator

Line break moves text to next line within same paragraph.

Horizontal rule separates sections.

Example:

```
Line 1<br>
Line 2
<hr>
Next Topic
```

Links

Links connect pages and resources.

Example:

```
<a href="https://example.com">Open Website</a>
```

Open in New Tab

```
<a href="https://example.com" target="_blank">Open in New Tab</a>
```

OUTPUT: Clicking opens the website in a new browser tab.

Link to Another Page (Internal Link)

```
<a href="about.html">About Page</a>
```

OUTPUT: Opens another page from the same website.

Email Link

```
<a href="mailto:abc@gmail.com">Send Email</a>
```

OUTPUT: Opens email application to send mail.

Images

Images add visual content.

Example:

```

```
